Wetlands

How do you access wetlands safely?

Walking the project site.

The surface conditions of a wetland vary, and may dictate different mat types throughout your project site. New South's project coordinator and manager walk a site to determine which mat or mats are needed to build a safe temporary roadway that is economically and environmentally sensible and responsible.

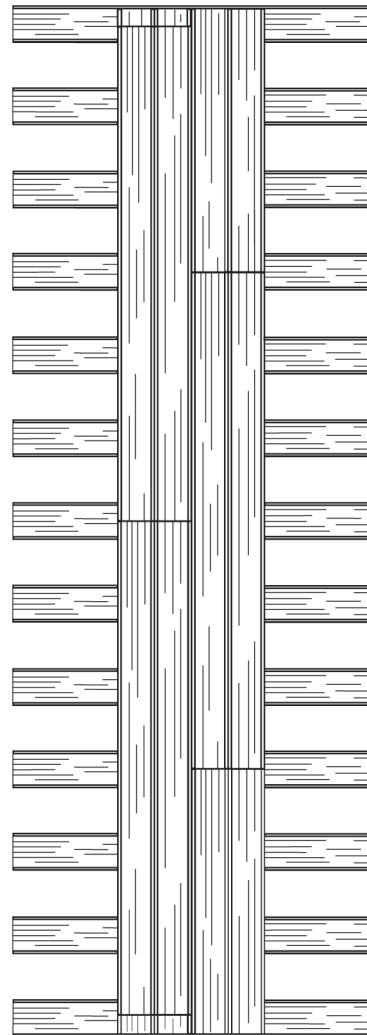

Efficient Access over Wetlands

New South is the world's leading environmental access company offering the best solutions for crossing wetlands.

We don't need to lose wetlands and we don't have to. New South can provide safe access on your project site that keeps your crews safe with little to no impact to the wetland. A couple of months after the project is completed, you won't be able to tell we were ever there.

BEFORE

DURING

AFTER

As New South project managers walk a project site, they survey soil conditions, review customer's work scope, equipment to be used, number of repetitive loads, access points, staging, job duration and environmental restrictions. This information is compiled and the most efficient access plan is created. These photographs tell the story of wetland access - the way it should be done. Rely on the experts to pave your way to safety, efficiency, and innovation that will keep you within budget, on deadline and in compliance.

Never, ever, ever
allow anyone
to stack mats
in wetlands
on your
project site.

Stacking mats can create a very unstable road for your crews, be very costly as you need much more matting material, destroy the wetlands, and lead to fines, penalties and poor public perception.
